Comfort air blower does not stop	Defective blower control board	end of this trouble shooting chart)		

ATTENTION: Before replacing any electrical component, be sure there is continuity in the wires that leads to that component.

HIGH EFFICIENCY II

UNDERSTANDING THE PRESSURE CONTROL

All High Efficiency II Furnaces are equipped with a pressure sensing device, this device performs the four important functions shown below.

*Prevents main burner operation in the event of inadequate combustion air or a failed combustion air blower.

*Prevents main burner operation in the event the vent or its terminal should become obstructed.

*Prevents main burner operation if the vent system is to long.

*Prevents main burner operation in the event the drain should become obstructed and backup.

This pressure device is commonly referred to as a pressure switch. The switch consists of normally open contacts which close when a specified amount of negative pressure (vacuum) is applied to the mechanical side of the device. The switch will remain closed as long as the required amount of negative pressure is present. If that negative pressure or vacuum reduces below the required amount, the switch contacts will open, thus shutting down the furnace. The source of this negative pressure is created within the combustion air blower housing, and is transferred from the blower housing to the pressure switch through a 1/4" diameter silicone tube. If any unusual restriction is applied any point downstream of the combustion air blower, the negative pressure or vacuum within the blower housing will decrease, opening the switch contacts and shutting down the furnace.

Table Al shows which pressure switch is used on various furnace models. Special attention should also be paid to vent size and permitted lengths.

	TABLE A1								
Furnace Model	Switch Part No.	Switch Contacts Close At	Switch Contacts Open At	Vent Size	Maximum Vent Length				
CH060D36B	8406-043	.43 Inches W.C.	.35 Inches W.C.	2" PVC	60 Equiv*Ft				
CH080D488	8406-042	.36 Inches W.C.	.28 Inches W.C.	2" PVC	30 Equiv*Ft				
CHO80048B	8406-042	.36 Inches W.C.	.28 Inches W.C.	3" PVC	60 Equiv*Ft				
CH100060B	8406-041	.41 Inches W.C.	.33 Inches W.C.	3" PVC	60 Equiv*Ft				
CC060D36A	8406-042	.36 Inches W.C.	.28 Inches W.C.	2" PVC	60 Equiv*Ft				
CC080D48A	8406-042	.36 Inches W.C.	.28 Inches W.C.	2" PVC	30 Equiv*Ft				
CC080D48A	8406-042	.36 Inches W.C.	.28 Inches W.C.	3" PVC	60 Equiv*Ft				
CC100D48A	8406-041	.41 Inches W.C.	.33 Inches W.C.	3" PVC	60 Equiv*Ft				

In determining equivalent footage, each foot of straight pipe counts as one foot. Each 45 degree fitting counts as 2-1/2 foot, and each 90 degree fitting counts as 5 foot.

PRESSURE MEASUREMENT WITHIN THE SYSTEM

To measure the pressure within the system, a pressure gauge with a range of 0 to 1 inch water column in .02 inch W.C. increments is required.

This gauge is to be connected to the silicone tubing between the pressure switch and the combustion air blower. Refer to Figure 1. A small plastic or copper tee and a 1/4" diameter piece of hose is used to connect the gauge between the combustion air blower and the pressure switch.

With the gauge in place, start the furnace and monitor the pressure within the system. The ignition device will be activated once the pressure exceeds the switch contact close points shown in Table Al. As the furnace warms up, the pressure will drop about .2" W.C. The pressure within the system should not drop to or below the switch contacts open point shown in Table Al. If the switch contacts open above the specified set point ± .03" W.C., the switch must be replaced. If the pressure within the system drops to the switch open set points, the following items should be checked.

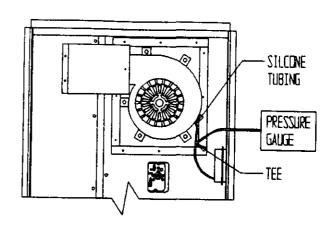

Figure 1

- 1. Vent diameter
- 2. Length of the vent
- 3. Sags, dips or low spots in the vent
- 4. Proper 1/4" per foot slope so that all condensate in the vent system can flow freely back to the furnace
- 5. Any obstruction in the vent or at the vent terminal
- 6. Any obstructions in the drain system
- 7. Any obstructions in the secondary heat exchanger
- 8. Any excessive lint, dirt or scale on the combustion air blower wheel
- 9. Any obstructions or moisture inside the 1/4" silicone tubing.
