① Maximum size of the time delay fuse or HACR type circuit breaker for protection of field wiring conductors.

Maximum KW that can operate with heat pump on is 9KW. Other 6KW energizes during emergency heating only.

ELECTRICAL SPECIFICATIONS Continued on Page 4 TABLE 2A

② Based on 75° C copper wire. All wiring must conform to the National Electrical Code and all local codes.

⁽³⁾ These "Minimum Circuit Ampacity" values are to be used for sizing the field power conductors. Refer to the National Electric Code (latest revision), article 310 for power conductor sizing. CAUTION: When more than one field power conductor circuit is run through one conduit, the conductors must be derated. Pay special attention to Note 8 of Table 310 regarding Ampacity Adjustment Factors when more than three conductors are in a raceway.

Maximum KW that can operate with heat pump on is 10KW. Other 5KW energizes during emergency heating only.

③ Maximum KW that can operate with heat pump on is 9KW. Other 6KW energizes during emergency heating only.

FIGURE 1 - UNIT DIMENSIONS

SHIPPING DAMAGE

Upon receipt of equipment, the carton should be checked for external signs of shipping damage. The skid must remain attached to the unit until the unit is ready for installation. If damage is found, the receiving party must contact the last carrier immediately, preferably in writing, requesting inspection by the carrier's agent.

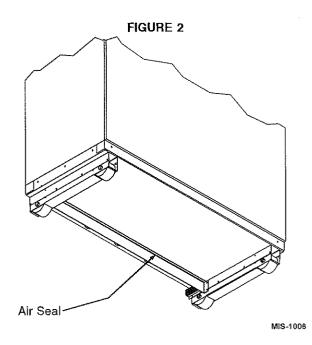

UNIT REMOVAL FROM SKID

MARNING

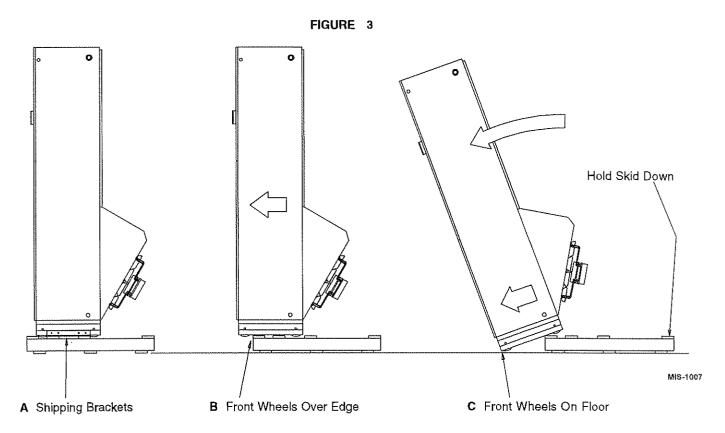

This unit is heavy and requires more than one person to handle and remove from the skid. Check unit wheels to ensure that wheels are locked before removing from skid. Extreme caution must be taken to prevent injury to personnel and damage to the unit.

It is recommended that the unit not be removed from the skid with a fork lift since the air seal under the unit could be damaged. See Figure 2.

The shipping brackets on each side of the unit must be removed and discarded. See Figure 3-A. The return air grille panel can be removed to provide a place to hold the unit. The unit can be slid forward on the skit until the front

wheels hang over the edge of the skid. See Figure 3-B. The unit can be tipped forward and slid down the edge of the skid until the front wheels touch the ground. See Figure 3-C. The wheels will not roll. They are shipped from the factory locked so they will not roll. The back of the skid will have to be held down to keep it from tipping up. The skid can be slid out from under the unit. The unit can then be set upright.

HANDLING UNIT AFTER REMOVAL FROM SKID

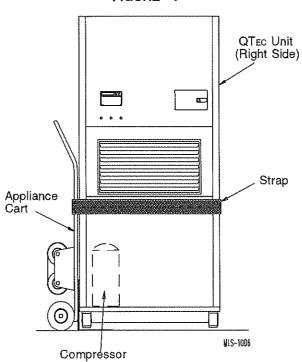

MWARNING

Exercise extreme caution when pushing the unit on the rollers. Handle and push from the lower 1/3 of the unit. Insure that debris is not on the floor where the unit is to be moved on the rollers. Failure to do so could result in the unit tipping over and causing bodily injury and/or damage to the unit.

The unit will have to be turned sideways and removed from the skid to fit through a 36" doorway. If the door height allows, the unit can be slid sideways through the door.

If the unit can not be slid through the door, then the unit will have to be put on a cart and tipped down to roll through the door. It is recommended that an appliance cart by used with a strap to hold the unit on the cart. The wheels of the unit must be locked. If the wheels were allowed to roll, the unit could roll off the cart. The unit should always be carted from the left side. This is the side where the compressor is located. See Figure 4. The blade of the appliance cart should be slid under the wheels of the unit. The strap of the appliance cart should be placed around the unit and strapped tightly. Help will be required to tip the unit back onto the cart. The unit can be leaned far enough back to be rolled through the door. Be careful when setting the unit back up to keep from damaging the unit.

FIGURE 4

MIS-1006

GENERAL

The equipment covered in this manual is to be installed by trained, experienced service and installation technicians.

The unit is designed for use with or without duct work. For use without duct work, Plenum Box QPB42 is recommended.

These instructions explain the recommended method to install the air cooled self-contained unit and the electrical wiring connections to the unit.

These instructions and any instructions packaged with any separate equipment required to make up the entire air conditioning system should be carefully read before beginning the installation. Note particularly "Start Procedure" and any tags and/or labels attached to the equipment.

While these instructions are intended as a general recommended guide, they do not supersede any national and/or local codes in any way. Authorities having jurisdiction should be consulted before the installation is made. See Page 1 for information on codes and standards.

Size of unit for a proposed installation should be based on heat loss calculation made according to methods of Air Conditioning Contractors of America (ACCA). The air duct should be installed in accordance with the Standards of the National Fire Protection Systems of Other Than Residence Type, NFPA No. 90A, and Residence Type Warm Air Heating and Air Conditioning Systems, NFPA No. 90B. Where local regulations are at a variance with instructions, installer should adhere to local codes.

MINIMUM INSTALLATION HEIGHT

The minimum installation height of the unit with a Free Blow Plenum is 8 ft. 6 in. This provides enough clearance for the plenum to be removed. See Figure 5.

The minimum installation height for ducted applications is 8 ft. 4-1/2 in. This provides enough clearance to install the duct work. See Figure 6.

FIGURE 5 - INSTALLATION WITH FREE BLOW PLENUM

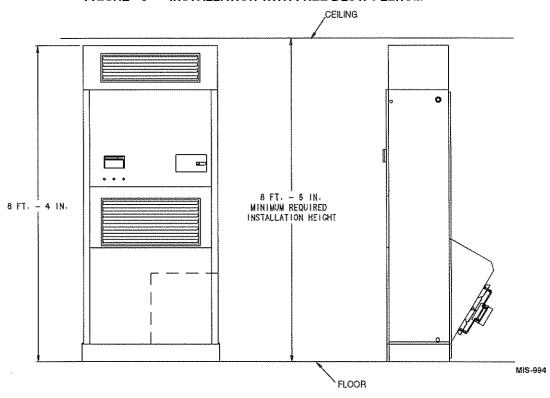

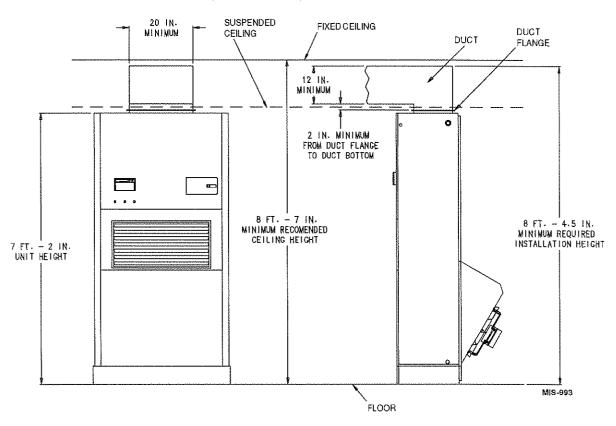

FIGURE 6 - DUCTED APPLICATION

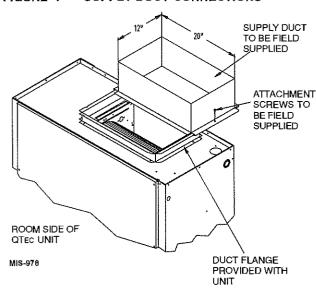

DUCT WORK

Any heat pump is more critical of proper operating charge and an adequate duct system than a straight air conditioning unit. All duct work must be properly sized for the design air flow requirement of the equipment. Air Conditioning Contractors of America (ACCA) is an excellent guide to proper sizing. All duct work or portions thereof not in the conditioned space should be properly insulated in order to both conserve energy and prevent condensation or moisture damage. When duct runs through unheated spaces, it should be insulated with a minimum of one inch of insulation. Use insulation with a vapor barrier on the outside of the insulation. Flexible joints should be used to connect the duct work to the equipment in order to keep the noise transmission to a minimum.

The QTEC series heat pump has provision to attach a supply air duct to the top of the unit. Duct connection size is 12 inches x 20 inches. The duct work is field supplied and must be attached in a manner to allow for ease of removal when it becomes necessary to slide the unit out from the wall for service. See Figure 7 for suggested attachment method.

FIGURE 7 - SUPPLY DUCT CONNECTIONS

NOTE: Unit cabinet, supply air duct and free blow plenum are approved for "0" clearance to combustible material.

The QTEC series heat pumps are designed for use with free return (non-ducted) and either free blow with the use of QPB42 Plenum Box or a duct supply air system.

The QPB42 Plenum Box mounts on top of the unit and has both vertically and horizontally adjustable louvers on the front discharge grille.

When used with a ducted supply, a QCX-10 Cabinet Extension can be used to conceal the duct work above the unit to the ceiling. This extends 20" above the unit for a total height above the floor of 10'-7/8". The unit is

equipped with a variable speed indoor blower motor which increases in speed with an increase in duct static pressure. The unit will therefore deliver proper rated air flow up to the Maximum ESP shown in Table 8. However, for quiet operation of the air system, the duct static should be kept as low as practical, within the guidelines of good duct design.

FILTERS

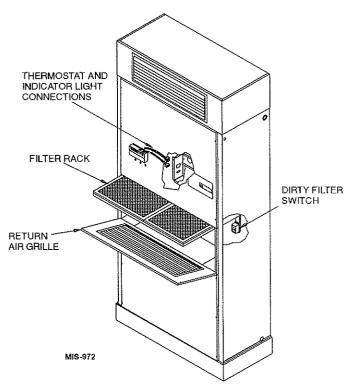

Two 1 inch throw away filters [(1) 16x16 and (1) 16x20] are supplied with each unit. An indicator light on the front exterior panel of the unit will be lit when the filters require service. The filters fit into a rack that slides into position. Refer to Figure 8.

The filters are serviced from the inside of the building by removing the return air grille panel. This panel is attached by four (4) 1/4 turn fasteners. The return air grille panel is equipped with a door switch that will shut the unit down while the filters are being serviced.

Once the filters are replaced, the dirty filter sensor must be reset to turn the indicator light off. The sensor is located on the right side of the unit just below the filter rack. See Figure 8. The knob on the front of the sensor should be turned clockwise to reset the sensor.

The internal filter brackets are adjustable to accommodate 2 inch filters. The tabs for the 1 inch filters must be bent down to allow the 2 inch filters to slide in place.

FIGURE 8 - FILTER LOCATION

DIRTY FILTER SWITCH ADJUSTMENT

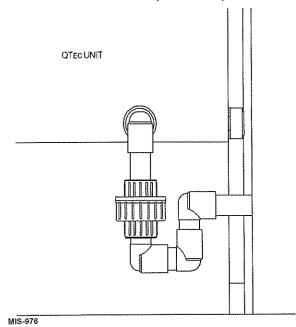

The dirty filter switch is located on the right side of the unit below the filter rack. (Refer to Figure 8 on Page 9.) The dirty filter switch alerts the user to a dirty filter by turning on the light in the front panel of the unit.

The dirty filter switch can be adjusted by turning the screw on the front of the switch. This must be done with the blower running and the filters in place. The desired restriction should be placed on the filters. This can be done by placing pieces of paper on the filters until the appropriate amount of the filters are covered. The recommended restriction is 75%. If the dirty filter flag appears in the window of the filter switch, turn the screw one turn clockwise and reset the filter switch window after it has been reset. Slowly turn the screw counterclockwise until the dirty filter flag appears in the filter switch window. Be sure to remove the restriction before putting the unit back into service.

FRESH AIR INTAKE

This unit is equipped with a fresh air damper assembly. The damper blade is locked in the closed position when the unit is shipped from the Factory. To allow the damper to operate remove the two plastic locking pins, one on each end of the blade. This will allow for maximum fresh air flow. The Damper blade will now open when the indoor blower is operating. If less than maximum fresh air flow is required, reinsert the plastic pins to limit damper blade opening to desired level. Two extra pins are provided (taped to the inside of the assembly) which may be used to hold the blade in some position other than minimum or maximum position. This fresh air assembly is located in the rear of the unit and to gain access to make these adjustments remove the air filter service door.

FIGURE 9 - SIDE DRAIN (SIDE VIEW)

All capacity, efficiency and cost of operation information as required for Department of Energy "Energyguide" Fact Sheets are based upon the fresh air blank-off plate in place and is recommended for maximum energy efficiency.

The blank-off plate is available upon request from the factory and is installed in place of the fresh air damper shipped with each unit.

For details on energy recovery ventilation see separate section.

CONDENSATE DRAIN

There are two drain connections on the unit. The side drain is located on the bottom right side of the unit. The rear drain is an optional drain, and is located on the right lower rear panel of the unit. The rear drain is shipped with a plug installed.

The side drain requires a water trap for proper drainage. See Figure 9. The drain can be routed through the floor or through the wall. If the drain is to be routed through an unconditioned space, it must be protected from freezing. The drain line must be able to be removed from the unit if it is necessary to remove the unit from the wall.

The rear drain can be used with wall thickness of up to 10 inches where a water trap can be installed between the unit and the interior wall. See Figure 10. The trap cannot extend beyond the edge of the unit or it will interfere with the wall mounting bracket. When the rear drain is used, the plug must be removed and installed in the side drain. The drain can be routed through the floor or through the wall. If the drain is routed through the wall, the drain line must be positioned such that it will not interfere with the sleeve flange or the grille. See Figure 11. If the drain is to be routed through an unconditioned space, it must be protected from freezing.

FIGURE 10 -- OPTIONAL REAR DRAIN

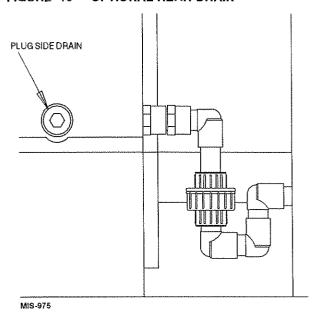

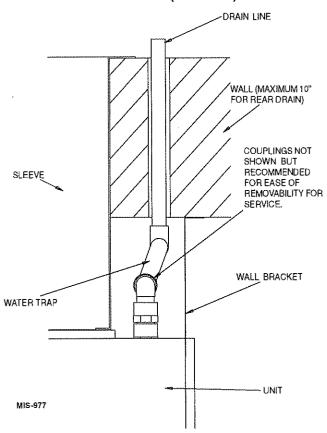

FIGURE 11 - REAR DRAIN (TOP VIEW)

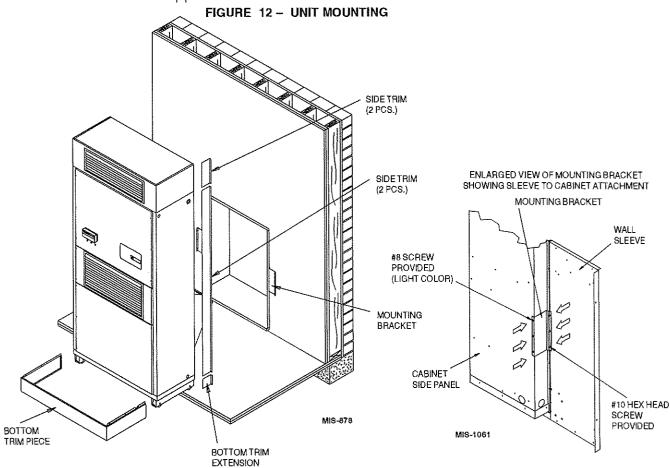

SERVICE LIGHTS

The unit is equipped with three service lights which signal the user that service is required. These lights are labeled Service Drain, Service Filter, and Service Unit. See Figure 14.

The Service Drain light indicates that there is water in the secondary drain pan and that the primary drain must be checked. This also shuts the unit off so that no additional water will be added which would cause the drain pan to overflow.

The Service Filter light indicates that the filters need to be changed. See the Filter section of this manual for service procedure.

The Service Unit light indicates that the unit has been shut off by a refrigerant control device. This indicates that the unit needs to be serviced.

Installation Instructions

MOUNTING THE UNIT

When installing a QTEC unit near an interior wall on the left side, a minimum of 8 inches is required; 12 inches is preferred.

When installing a QTEC unit near an interior wall on the right side, a minimum of 18 inches is required as additional space is required to connect the side drain. If the rear condensate drain kit QCDS48 is used the minimum can be reduced to 8 inches.

This clearance is required to allow for the attachment of the unit to the sleeve and side trim pieces to the wall.

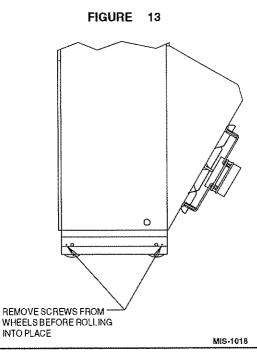

This unit is to be secured to the wall sleeve with mounting brackets provided. The unit itself, the supply duct and the free blow plenum are suitable of "0" clearance to combustible material.

Following are the steps for mounting the QTEC, for reference see Figure 12 (page 11).

- Attach mounting brackets to the wall sleeve with screws provided.
- Position the unit in front of the sleeve with the condenser section toward the sleeve.
- 3. Remove the locking screws from the wheels. Refer to Figure 13.

- 4. Roll the unit into the sleeve. Make sure to check both sides of the unit as it is being rolled to keep it centered in the sleeve. Also check the alignment to the mounting brackets. This unit must be level from side to side. If adjustments are necessary, shim up under the rollers with sheets of steel or any substance that is not affected by moisture.
- 5. Make sure the gasket on the rear of the unit is touching the sleeve across the top and down both sides. This is a rain water seal.
- 6. Secure the mounting brackets to the unit with screws provided, #10 hex head sheet metal screws.
- Bottom trim extensions are provided for use when wall is less than 14 inches but greater than 10.5 inches. Secure to wall with screws (not provided).
- 8. Attach the bottom trim piece to the unit with the screws provided (dark colored).
- 9. Position side trim pieces to wall and attach with field supplied screws. There are two long pieces and two short pieces supplied. The long pieces are to enclose the gap behind the unit. The short pieces are to fill the gap behind the cabinet extension or the free blow plenum box. The may be cut to suit your ceiling height or overlap the unit side trim. There is sufficient length to trip up to a 10'2" ceiling.

NOTE: If the exterior wall thickness is between 5 inches to 10.5 inches, a side trim extension piece kit, model QSTX42, is available.

WIRING - MAIN POWER

Refer to the unit rating plate and/or Table 2 for wire sizing information and maximum fuse or "HACR Type" circuit breaker size. Each unit is marked with a "Minimum Circuit Ampacity". This means that the field wiring used must be sized to carry that amount of current. Depending on the installed KW of electric heat, there may be two field power circuits required. If this is the case, the unit serial plate will so indicate. All models are suitable only for connection with copper wire. Each unit and/or wiring diagram will be marked "Use Copper Conductors Only". These instructions MUST BE adhered to. Refer to the National Electrical Code (NEC) for complete current carrying capacity data on the various insulation grades of wiring material. All wiring must conform to NEC and all local codes.

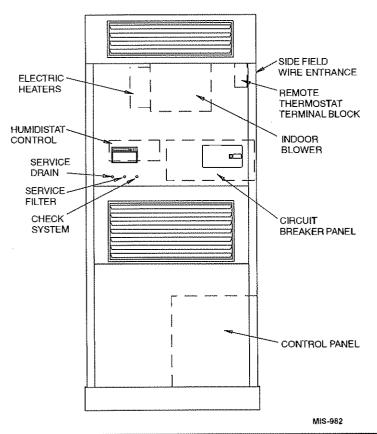

The electrical data lists fuse and wire sizes (75° C copper) for all models, including the most commonly used heater sizes. Also shown are the number of field power circuits required for the various models with heaters.

The unit rating plate lists a "Maximum Time Delay Relay Fuse" or "HACR Type" circuit breaker that is to be used with the equipment. The correct size must be used for proper circuit protection, and also to assure that there will be no nuisance tripping due to the momentary high starting current of the compressor motor.

The disconnect access door on this unit may be locked to prevent unauthorized access to the disconnect.

See Start Up section for information on three phase scroll compressor start-ups.

FIGURE 14 - COMPONENT LOCATION

The field wiring connections are located behind the top panel in the circuit breaker panel. The return air panel must be removed first. This panel is equipped with a door switch which shuts the unit down when it is removed. The filter rack must be removed next. The connections for the thermostat and the indicator lights must be disconnected before the top panel can be removed. See Figure 14. The connections are located behind the top panel.

The top panel should remain fastened to the unit until the connectors have been disconnected, or damage to the connectors may occur. The locking tabs on either side of the connectors must be released. The connector can be pulled straight out of the socket. Once all the connectors have been removed, the top panel can be removed.

WIRING - LOW VOLTAGE WIRING

230/208V, 1 PHASE AND 3 PHASE EQUIPMENT DUAL PRIMARY VOLTAGE TRANSFORMERS.

All Equipment leaves the factory wired on 240V tap. For 208V operation, reconnect form 240V to 208V tap. The acceptable operating voltage range for the 240 and 208V taps are as noted in Table 3.

TABLE 3 - OPERATING VOLTAGE RANGE

ТАР	RANGE
240V	253 - 216
208V	220 - 187

NOTE: The voltage should be measured at the field power connection point in the unit and while the unit is operatin at full load (maximum amperage operating condition).

The standard climate control option is a remote thermostat connection terminal block. See Figure 16A for wiring diagram. Compatible thermostats are listed in Table 4.

The Climate Control *Option E* is an electronic, programmable thermostat and a humidistat. The sub base of the thermostat and the humidistat are factory wired to the front panel of the unit. Compatible for use with Energy Recovery Ventilator or Economizer.

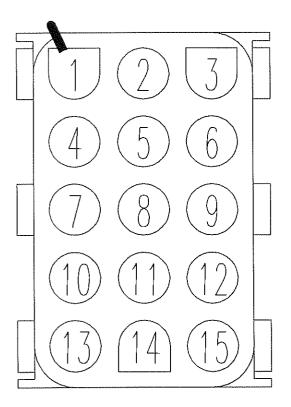

The Climate Control $Option\ F$ is an electronic, non-programmable thermostat, timer and a humidistat. The sub base of the thermostat and the timer are factory wired to the front panel of the unit. Compatible for use with Energy Recovery Ventilator or Economizer.

TABLE 4 - WALL THERMOSTATS AND SUBBASE COMBINATIONS

Thermostat	Subbase	Predominant Features
8403-018 (T874N1024)	8404-010 (Q6741261)	Automatic Heat/Cool (2) Changeover Position
8403-034 (1F94-80)	N/A	Programable Heat/Cool Electronic
8403-038 (H600A)	N/A	Humidistat
8403-042 (T8511G1070)	N/A	Manual/Auto/ Heat/Cool Non-Progammable Electronic

Start Up

DESCRIPTION OF STANDARD EQUIPMENT

Solid State Electronic Heat Pump Control

Provides efficient 30 minute defrost cycle. A thermistor sensor and speed up terminal for service along with a 10 minute defrost override are standard on the electronic heat pump control.

High / Low Pressure Switch

Provides refrigerant circuit high pressure and loss of charge protection. Includes lockout circuit that is re-settable from room thermostat.

Five Minute Compressor Time Delay

Provides short cycle protection for the compressor which extends compressor life. Built into the electronic heat pump control as standard.

Service Lights

3 service lights indicate when service is required.

- Check System detects high or low pressure switch operation for compressor protection.
- Service Filter detects a dirty filter condition.
- Service Drain detects a clogged drain by detecting water in the secondary drain system. Shuts system down until corrective action is taken.

Two Speed Outdoor Motor

Has two speeds and is controlled by an outdoor thermostat.

Interlock Door Switch

When the service door is removed, automatically shuts the unit down.

OPTIONAL CFM (QH361, QH421 and QH481 ONLY)

These units are shipped from the factory set to operate at the optional CFM level shown in Table 9. This provides lower operating sound levels for non-ducted, free discharge applications. This CFM level will reduce the system capacity performance by approximately 2% at the same energy efficiency.

Rated CFM is required for ducted applications for maximum performance rating. To obtain full CFM on these models, connect jumper wire as follows:

- 1. Disconnect all power to the unit. Failure to do so may result in damage to the motor.
- 2. Remove Return Air access panel.
- 3. Remove Filter Rack.
- 4. Unplug Service Lights and Thermostat Options. (See Figure 3.)
- 5. Remove upper door.
- 6. Remove inner control panel cover.
- Add pink jumper wire (provided) to terminal 5 and 6 on the terminal board.
- 8. Reverse steps to reassemble.

IMPORTANT INSTALLER NOTE

For improved start-up performance, wash the indoor coil with a dishwasher detergent.

THREE PHASE SCROLL COMPRESSOR START UP INFORMATION

Scroll compressors, like several other types of compressors, will only compress in one rotational direction. Direction of rotation is not an issue with single phase compressors since they will always start and run in the proper direction.

However, three phase compressors will rotate in either direction depending upon phasing of the power. Since there is a 50-50 chance of connecting power in such a way as to cause rotation in the reverse direction, <u>verification of proper rotation must be made</u>. Verification of proper rotation direction is made by observing that suction pressure drops and discharge pressure rises when the compressor is energized. Reverse rotation also results in an elevated sound level over that with correct rotation, as well as, substantially reduced current draw compared to tabulated values.

Verification of <u>proper rotation</u> must be made at the time the equipment is put into service. If improper rotation is corrected at this time there will be no negative impact on the durability of the compressor. However, reverse operation for oven one hour may have a negative impact on the bearing due to oil pump out.

NOTE: If compressor is allowed to run in reverse rotation for several minutes the compressor's internal protector will trip.

All three phase scroll compressors used in the QTEC series are wired identically internally. As a result, once the correct phasing is determined for a specific system or installation, connecting properly phased power leads to the same Fusite terminal should maintain proper rotation direction. The direction of rotation of the motor may be changed by reversing any two line connections to the unit.

SERVICE HINTS

- Caution user to maintain clean air filters at all times.
 Also, not to needlessly close off supply air registers.
 This may reduce air flow through the system, which shortens equipment service life as well as increasing operating costs and noise levels.
- 2. Switching to heating cycle at 75°F or higher outside temperature may cause a nuisance trip of the remote reset high pressure switch. Turn thermostat off, then on to reset the high pressure switch.
- The heat pump wall thermostats perform multiple functions. Be sure that all function switches are correctly set for the desired operating mode before trying to diagnose any reported service problems.

- Check all power fuses or circuit breakers to be sure they are the correct rating.
- 5. Periodic cleaning of the outdoor coil to permit full and unrestricted airflow circulation is essential.
- 6. Some service requires the need to remove the unit from the wall including replacement of the indoor coil and/or the outdoor coil. Also servicing the outdoor fan motor or fan blade will require removing the unit from the wall if the unit is installed at a height that is not easily accessible from the outside of the building.

In order to remove the unit from the wall the following procedure must be used:

- a. Turn off power to the unit at the remote location. Some units may have more than one power supply.
- Disconnect field wiring at unit terminal block and remove from unit.
- c. Disconnect condensate drain.
- d. Remove the lower skirting around the unit.
- e. Remove wall mounting brackets from wall on each side of the unit.
- f. If unit is attached to duct work, remove upper cabinet extension by removing the top center screw only from the cabinet side panel.
- g. Remove screws that attach the duct work to the unit flanges.

This unit is equipped with four rollers mounted to the base. For ease of pulling unit out from the wall, you may want to remove the bottom service door which requires removal of the return air panel, and grip the front flange of the base pan then pull straight out.

- Annual maintenance is required to make sure that all of the systems are functioning properly.
 - Check to make sure that the drains are not obstructed in any way.
 - b. Check the water level switch operation.
 - c. Remove any debris in the condenser section of the
 - d. Inspect and clean mist eliminator as described below
 - e. Inspect and wash outdoor coil as necessary.

MIST ELIMINATOR SERVICE

A mist eliminator is supplied with the wall sleeve. The mist eliminator is constructed of an aluminum frame and mesh. The mist eliminator is located in the top section of the wall sleeve and can be removed from the inside of the building without removing the unit from the wall. This requires that the ventilation package must be removed.

It is recommended that the mist eliminator be inspected annually and serviced as required. The mist eliminator can be inspected from the outside of the building by looking through the outdoor grille. The mist eliminator can be serviced from the outside by using a vacuum cleaner. The outdoor grille must be removed. Use the vacuum to remove dirt and debris from the surface of the mist eliminator. If additional cleaning is required, the mist eliminator will have to be removed from the sleeve.

The ventilation package will have to be removed to gain access tot he mist eliminator. If the blank off plate option is used, it is not necessary to service the mist eliminator. The steps necessary to remove each of the vent options are listed below.

The mist eliminator can be cleaned by washing with soap and water. The excess water should be shaken off the mist eliminator before it is reinstalled.

BAROMETRIC FRESH AIR DAMPER (Standard)

Before starting, make sure the power has been turned off. The return air grille panel must be removed. The fresh air damper assembly can be seen on the back of the unit. See Figure 17.

- The fresh air damper is attached to the back of the unit with one screw on either side of the assembly. Both of the screws must be removed.
- Once the mounting screws are removed, tilt the assembly down and lift it out.

The mist eliminator can be seen through the opening. The mist eliminator must be raised up and the bottom can be pulled toward the front of the unit.

ECONOMIZER (Option)

Before starting, make sure the power has been tuned off. The return air grille panel must be removed. The economizer (ECON) can be seen after the panel has been removed.

- 1. The two mounting screws in the front of the ECON must be removed.
- The power connectors for the ECON (located on the right side of the unit) must be disconnected. Squeeze the tabs on the sides of the connector and pull straight out. Unplug both of the connectors.
- 3. Slide the ECON straight out of the unit.

The mist eliminator can be seen through the opening in the back of the unit. The mist eliminator must be raised up and the bottom can be pulled toward the front of the unit and removed.

COMMERCIAL ROOM VENTILATOR (Option)

Before starting, make sure the power has been turned off. The return air grille panel must be removed. The commercial room ventilator (CRV) can be seen after the panel has been removed. The CRV must be remove to gain access to the mist eliminator.

- The two mounting screws in the front of the CRV must be removed.
- The power connectors for the CRV (located on the right side of the unit) must be disconnected. Squeeze the tabs on the sides of the connector and pull straight out. Unplug both of the connectors.
- 3. Slide the CRV straight out of the unit.

The mist eliminator can be seen through the opening in the back of the unit. The mist eliminator must be raised up and the bottom can be pulled toward the front of the unit and removed.

QTec R ENERGY RECOVERY VENTILATOR (Option)

Before starting, make sure that the power has been turned off. The return air grille panel must be removed. The energy recovery ventilator (QERV) can be seen after the panel has been removed. To gain access to the mist eliminator, the QERV must be removed. See Figure 18.

- The front fill plate of the QERV must be removed.
 There is one screw on either side of the plate. Remove these screws and remove the plate.
- On either side of the QERV there are mounting screws that hold the QERV in place. Remove both of these screws.
- 3. Underneath the heat recovery cassette there is a power connector for the lower blower assembly. To disconnect this plug, the tabs on both sides of the plug must be squeezed to release the plug. While squeezing the tabs, pull the plug out of the socket.
- 4. The QERV is plugged into the unit in the right side of the unit. Both of these plugs must be disconnected to remove the QERV. Squeeze the tabs on the sides of the connector and pull straight out.
- 5. Slide the QERV assembly straight out of the unit, being careful not to let the cassette slide out of the QERV.

The mist eliminator can be seen through the opening in the back of the unit. The mist eliminator must be raised up and the bottom can be pulled toward the front of the unit and removed.

FIGURE 17 FRESH AIR DAMPER REMOVAL

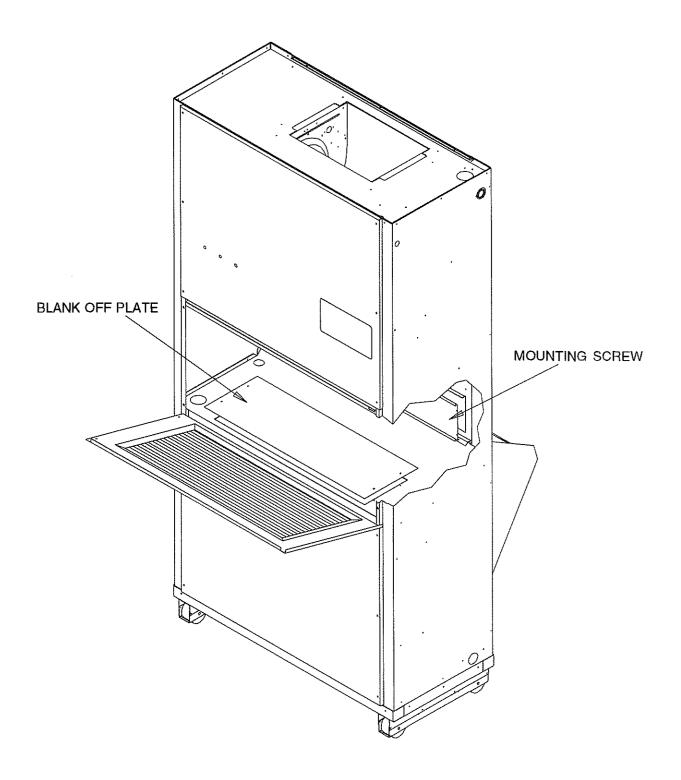

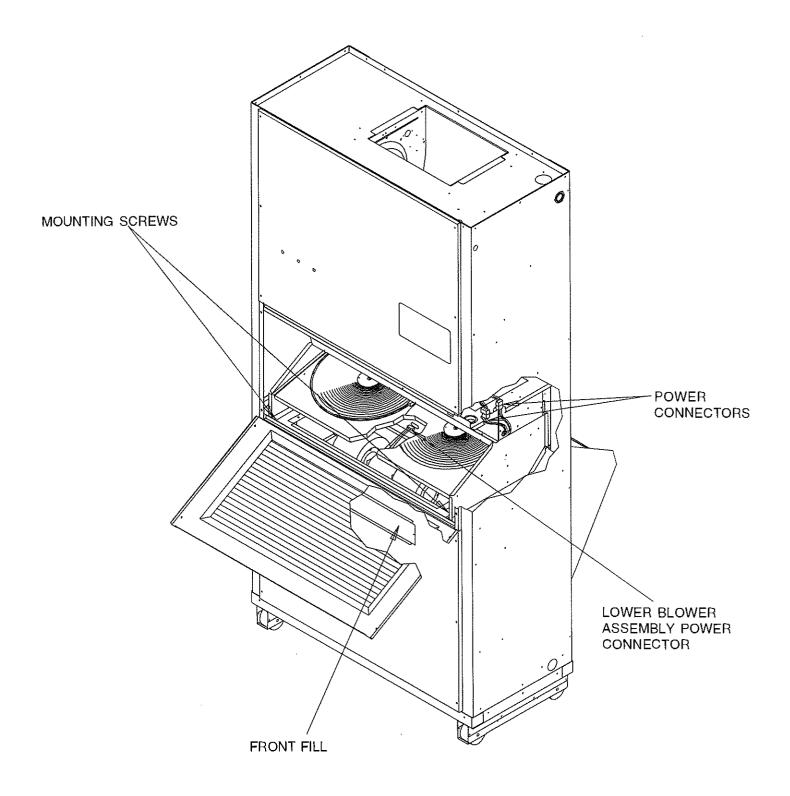

FIGURE 18 QERV REMOVAL

SEQUENCE OF OPERATION

Cooling – Circuit R-Y makes the thermostat pull in the compressor contactor starting the compressor and outdoor motor. The G (indoor motor) circuit is automatically completed on any call for cooling operation, or can be energized by manual fan switch on subbase for constant air circulation.

Heating — A 24V solenoid coil on reversing valve controls heating cycle operation. Two thermostat options, one allowing "Auto" change over from cycle to cycle and the other constantly energizing solenoid coil during heating season and thus eliminating pressure equalization noise except during defrost, are to be used on "Auto" option, a circuit is completed for R-W1 and R-Y on each heating "on" cycle, energizing reversing valve solenoid and pulling in compressor contactor starting compressor and outdoor motor. R-G also makes starting indoor blower motor. Heat pump heating cycle now in operation.

The second option has no "Auto" change over position, but instead energizes the reversing valve solenoid constantly whenever the system switch on subbase is placed in "Heat" position, the "B" terminal being constantly energized from R. A thermostat demand for heat completes R-Y circuit, pulling in compressor contactor starting compressor and outdoor motor. R-G also make starting indoor blower motor.

Reheat Circuit There is a small capillary tube inserted between the reheat coil return line and suction line that will prevent liquid from accumulating in the reheat coil when it is inactive. This drain does not affect the normal operation of the system.

There is a check valve located in the reheat coil return line. It has a soft spring to hold the ball on the seat. This will make the method of checking the ball freedom with a magnet difficult. Refer to Figures 18 and 19 for the location of the check valve and drain back capillary.

When the system is operating in the dehumidification mode the suction pressure will be reduced by 4 to 8 psig and the discharge pressure will be reduced by 19 to 22 psig.

Freeze Thermostat If the freeze thermostat senses a 32° evaporator temperature the compressor will be shut off. The blower will continue to run until the coil is defrosted and then the compressor will start again.

Return Air Thermostat In dehumidification mode if the return air temperature is lower than 65°, the return air thermostat closes and brings on stage one electric heat to maintain 65°.

High / Low Pressure control provides protection for the compressor. In the advent system pressures go above 350 PSI or below 15 PSI in either cooling or heating mode the compressor will be stopped. This will activate the right hand red light marked "System Service" on the front of the unit. The lockout circuit will hold compressor off line. When the system problem is corrected, the unit operation can be restored by turning of the main power supply off and then back on, or reset the room thermostat. The low pressure control has a bypass to eliminate nuisance lockout on cold start up.

Two Speed Outdoor Fan Motor There is a thermostat located in the main electrical box that controls the switching between high and low speed. When in cooling mode and the outdoor ambient temperature is above 80 degrees, the outdoor motor will run on high speed; below 80 degrees, it will run on low speed. In heating mode the outdoor fan will always run in high speed.

Door Interlock Switch When the center cabinet panel (the one with the return air grille) is removed, the interlock switch will shut down the whole unit. When this panel is replaced, the unit will be able to start up. NOTE: This panel must be removed before either of the remaining upper or lower panels can be removed.

Dirty Filter Switch When the filters become dirty, the dirty filter switch will activate the center light marked "Filter Service" on the front of the cabinet. After the dirty filters have been replaced the dirty filter switch must be reset by turning the reset knob counter clockwise.

Five Minute Compressor Time Delay This delay is built into the electronic heat pump control. It provides short cycle protection for the compressor.

Clogged Drain Switch This switch is mounted in the bottom of the unit behind the lower electrical box with a probe extending above the unit base pan. In the advent the drains become clogged, this switch will shut down the unit before the water level in the unit base becomes high enough to allow water to enter the indoor side. This will activate the left hand red service light marked "Drain Service" on the front of the unit. When the clogged drain is corrected and the water level in the unit base pan is at an acceptable level, the unit will start up. The switch should be operated manually at least once a year to insure the float is free to rise in the event of high water level.

OPTIONAL CLIMATE CONTROLS SEQUENCE OF OPERATION

The Climate Control **Option E** is an electronic, programmable thermostat and a humidistat. This unit has a refrigerant reheat circuit that is controlled by a 3-way valve.

When the humidity is above the setpoint of the humidistat, the compressor circuit and the 3-way valve are energized and the evaporator air flow is reduced. The 3-way valve directs hot discharge gas into a separate desuperheating condenser circuit that reheats the conditioned air before it is delivered to the room. When the humidistat is satisfied, the system switches back to normal air conditioning mode.

If the thermostat calls for cooling during dehumidification mode, the call for cooling takes precedence over the dehumidification and the unit will cool until the thermostat is satisfied. Once the call for cooling is satisfied, the unit may continue to dehumidify.

If the thermostat calls for heat when the unit is in the dehumidification mode, the electric heaters will energize and the evaporator air flow will return to the heating air flow. When the thermostat is satisfied, the electric heaters will turn off and the air flow will be reduced and the system will continue to dehumidify until humidistat is satisfied.

If the unit is running in heat pump mode and the humidistat calls for dehumidification, the heat pump mode takes precedence over dehumidification. The unit will not return to the dehumidification mode until the heating thermostat is satisfied.

The Climate Control Option F has a non-programmable electronic thermostat, timer, and humidistat. This unit has a refrigerant reheat circuit that is controlled by a 3-way valve.

Unit operation is controlled by the manually operated timer. Normal heating, cooling or ventilation is available only when the timer is on. Dehumidification can be set to be available only when the timer is on, or to be available continuously by switching a toggle switch.

When the humidity is above the setpoint of the humidistat, the compressor circuit and the 3-way valve are energized and the evaporator air flow is reduced. The 3-way valve directs hot discharge gas into a separate desuperheating condenser circuit that reheats the conditioned air before it is delivered to the room. If the return air thermostat sensed a temperature below 65° during dehumidification, the fist stage electric heaters are brought on to raise the return air temperature above 65°. When the humidistat is satisfied, the system switches back to normal air conditioning mode.

If the thermostat calls for cooling during dehumidification mode, the call for cooling takes precedence over the dehumidification and the unit will cool until the thermostat is satisfied. Once the call for cooling is satisfied, the unit may continue to dehumidify.

If the thermostat calls for heat when the unit is in the dehumidification mode, the electric heaters will energize and the evaporator air flow will return to the heating air flow. When the thermostat is satisfied, the electric heaters will turn off and the air flow will be reduced and the system will continue to dehumidify until humidistat is satisfied.

If the unit is running in heating mode and the humidistat calls for dehumidification, the heating mode takes precedence over dehumidification. The unit will not return to the dehumidification mode until the heating thermostat is satisfied.

REFRIGERANT TUBE SCHEMATIC FOR REHEAT COIL

Figure 19 shows the refrigerant gas flow through the reheat coil during the dehumidification mode.

When the unit is in standard cooling (Figure 20) or heating mode the reheat coil is inactive.

PRESSURE SERVICE PORTS

High and low pressure service ports are installed on all units so that the system operating pressures can be observed. Pressure curves can be found later in the manual covering all models on both cooling and heating cycles. It is imperative to match the correct pressure curve to the unit by model number. All service doors must be attached to obtain proper reading.

FIGURE 19
QTEC DEHUMIDIFICATION MODE CIRCUIT DIAGRAM

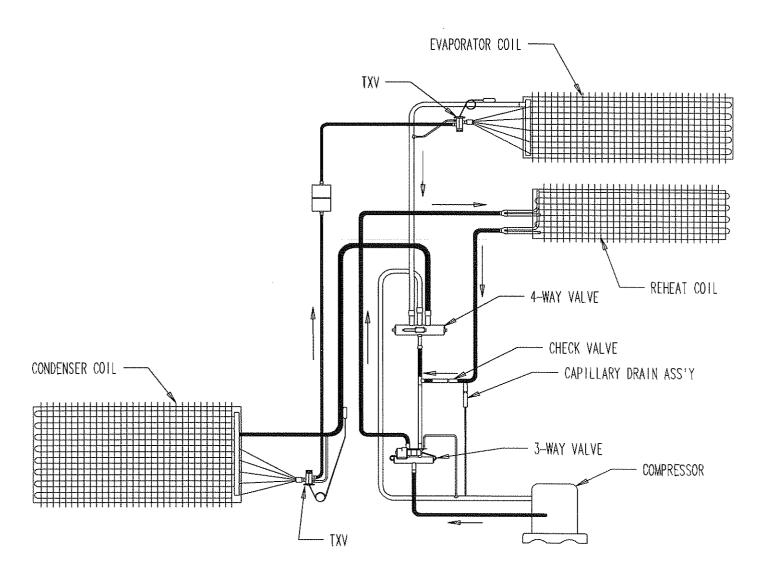

FIGURE 20 QTec COOLING MODE CIRCUIT DIAGRAM

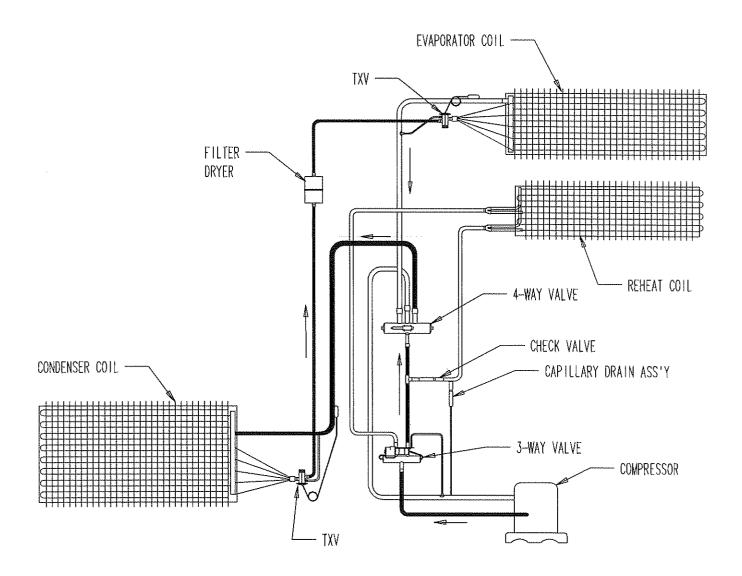

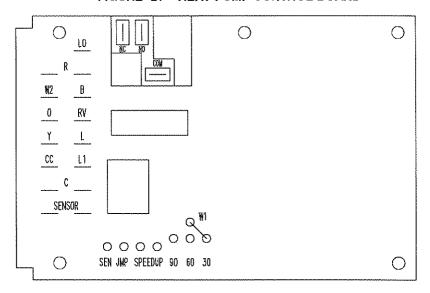

FIGURE 21- HEAT PUMP CONTROL BOARD

DEFROST CYCLE

The defrost cycle is controlled by temperature and time on the solid state heat pump control.

When the outdoor temperature is in the lower 40°F temperature range or colder, the outdoor coil temperature is 32°F or below. This coil temperature is sensed by the coil sensor mounted near the bottom of the outdoor coil. Once coil temperature reaches 30°F or below, the coil sends a signal to the control logic of the heat pump control and the defrost timer will start.

After 30 minutes at 30°F or below, the heat pump control will place the system in the defrost mode.

During the defrost mode the refrigerant cycle switches back to the cooling cycle, the outdoor motor stops, electric heaters are energized, and hot gas passing through the outdoor coil melts any accumulated frost. When the temperature rises to approximately 57°F, the coil sensor will send a signal to the heat pump control which will return the system to heating operations automatically.

If some abnormal or temporary condition such as a high wind causes the heat pump to have a prolonged defrost cycle, the heat pump control will restore the system to heating operation automatically after 10 minutes.

There are three settings on the heat pump control -30 minute, 60 minute and 90 minute. Models are shipped wired on the 30 minute setting for greatest operating economy. If special circumstances require a change to another time, remove wire connected to terminal 30 and reconnect to desired terminal. Refer to Figure 21. The manufacturer's recommendation is for 30 minute defrost cycles.

There is a cycle speed up jumper on the control. This can be used to reduce the time between defrost cycle operation without waiting for time to elapse.

There is an initial defrost jumper (sen jmp) on the control that can be used at any outdoor ambient during the heating cycle to simulate a 0° coil temperature. This can be used to check defrost operation of the unit without waiting for the outdoor ambient to fall into the defrost region.

Troubleshooting

SOLID STATE HEAT PUMP CONTROL TROUBLESHOOTING PROCEDURE

- 1. Turn on AC power supply to indoor and outdoor units.
- 2. Turn thermostat blower switch to "fan on" the indoor blower should start. (If it doesn't, troubleshoot indoor unit and correct problem.)
- 3. Turn thermostat blower to "auto" position. Indoor blower should stop.
- 4. Set system switch to "heat" or "cool". Adjust thermostat to call for heat or cool. The indoor blower, compressor and outdoor fan should start.

NOTE: If there was no power to 24 volt transformer, the compressor and outdoor fan motor will not start for 5 minutes. This is because of the compressor short cycle protection.

TABLE 5 - TROUBLESHOOTING

Sympton	Possible Cause	What to Check	How to Check or Repair
Compressor contactor does not energize	Control circuit wiring	Check for R connection at unit, and 24V between R-C.	Run R connection to outdoor unit to power heat pump control.
(cooling or heating)	Compressor lock out	Check for 24V between L1-C on heat pump control.	If no voltage between L1-C turn thermostat off and on again to reset high pressure switch.
		Check across high pressure switch.	If high pressure switch is open and will not reset, replace high pressure switch.
	Compressor short cycle protection	Check for 24V between CC-C and Y-C on heat pump control.	If no voltage between CC-C jumper speed up terminal and within 10 seconds power should appear between CC-C. Remove speed up jumper after 10 seconds.
	Heat pump control defective	Check all other possible causes. Manual 2100-034	Replace heat pump control.
	Contactor defective	Check for open or shorted coil winding.	Replace contactor.
Fan outdoor motor does not run	Motor defective	Check for open or shorted motor winding.	Replace motor.
(cooling or heating except during defrost)	Motor capacitor defective	Check capacitor rating. Check for open or shorted capacitor.	Replace capacitor.
	Heat pump control defective	Check across fan relay on heat pump control (Com-NC)	Replace heat pump control.
Reversing valve does not energize	Reversing valve solenoid coil defective	Check for open or shorted coil.	Replace solenoid coil.
(heating only)	Heat pump control defective	Check for 24V between RV-C and B-C.	Check control circuit wiring. Replace heat pump control
Unit will not go into defrost (heating only)	Temperature sensor or heat pump control defective	Disconnect temperature sensor from board, and jumper across speed up terminals and sen jmp terminals. This should cause the unit to go through a defrost cycle within one minute.	1) If unit goes through defrost cycle, replace temperature sensor. 2) If unit does not go through defrost cycle, replace heat pump control.
Unit will not come out of defrost (heating only)	Temperature sensor or heat pump control defective	Jumper across speed up terminals. This should cause the unit to come out of defrost within one minute.	1) If unit comes out of defrost cycle, replace temperature sensor. 2) If unit does not come out of defrost cycle, replace heat pump control.

CHECKING TEMPERATURE SENSOR

- 1. Disconnect temperature sensor from board and from outdoor coil.
- 2. Use an ohmmeter and measure the resistance of the sensor. Also use ohmmeter to check for short or open.
- 3. Check resistance reading to chart of resistance use sensor ambient temperature. (Tolerance of part is ± 10%.)
- 4. If sensor resistance reads very low, then sensor is shorted and will not allow proper operation of the heat pump control.
- 5. If sensor is out of tolerance, shorted, open, or reads very low ohms then it should be replaced.

TABLE 6

FAN BLADE SETTING DIMENSIONS

Any service work requiring removal or adjustment in the fan and/or motor area will require that the dimensions in Table 7 be checked and blade adjusted in or out of the motor shaft accordingly.

FIGURE 22 - FAN BLADE SETTING

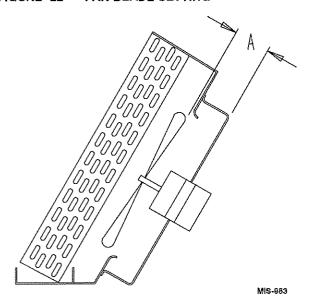

TABLE 7 - FAN BLADE DIMENSIONS

MODEL	DIMENSION A (INCHES)
QH241	.750
QH301	.750
QH361	.750
QH421	.750
QH481	.7 50

REFRIGERANT CHARGE

The correct system R-22 charge is shown on the unit rating plate. Optimum unit performance will occur with a refrigerant charge resulting in a suction line temperature (6 inches from compressor) as shown in Table 8.

TABLE 8 -- SUCTION LINE TEMPERATURE DEGREES F

MODEL	RATED CFM	95 F OD TEMPERATURE	82 F OD TEMPERATURE
QH241	800	16 - 18	14 - 16
QH301	1000	16 - 18	15 - 17
QH361	1200	16 - 18	14 - 16
QH421	1200	19 - 21	16 - 18
QH481	1200	23 - 25	22 - 24

TABLE 9 -- INDOOR BLOWER PERFORMANCE

MODEL	RATED ESP	① MAX. ESP	② RATED CFM	③ OPTIONAL CFM	4 CONTINUOUS CFM	⑤ DEHUMIDIFICATION CFM	CFM @ MAX. ESP
QH241 ⑥	.10	0.5	800		800	500	700
QH301	.15	0.8	1000		1000	700	910
QH361	.15	0.8	1200	1000	1000	850	1175
QH421	.15	0.8	1200	1000	1000	850	1175
QH481	.15	8,0	1400	1100	1100	850	1175

NOTE: These units are equipped with a variable speed (ECM) indoor motor that automatically adjust itself to maintain approximately the same rate of indoor air flow in both heating and cooling, dry and wet coil conditions and at both 230/208 or 460 volts.

- (1) Maximum ESP (inches WC) shown is with 1" thick disposable filter (reduced by .2 for 2" filter).
- <u>Pated CFM</u> for ducted applications required for maximum performance rating. To obtain full CFM on models QH361 and QH421, connect the pink jumper wire (provided_ to terminal #5 and #6 on the low voltage terminal block located in the circuit breaker box.
- Optional CFM the unit is shipped from the factory set to operate at the optional CFM level shown. This provides lower operating sound levels for non-ducted, free discharge applications. This reduces system capacity performance by approximately 2% at the same energy efficiency.
- 4) Continuous fan CFM is the total air being circulated during continuous fan mode.
- (5) Indoor air flow during periods of high humidity when system is operating under control of optional humidistat for maximum humidity reduction.
- (6) Models QH241 when operating on 2nd stage heating the indoor air will increase to 1000 CFM.

Low side pressure ±2 psig High side pressure ± 5 psig

Tables are based upon rated CFM (airflow) across the evaporator coil. If there is any doubt as to correct operating charge being in the system, the charge should be removed, system evacuated and recharged to serial plate instructions.

OPTIONAL ACCESSORIES

MODEL	DESCRIPTION					
QLG-10	Outdoor louver grille, clear anodized aluminum for 2, 2-1/2, 3, 3-1/2 Ton QTEc Models [™]					
QLG-15	Outdoor louver grille, clear anodized aluminum for 4 Ton QTEC Models TM					
QLG-20	Outdoor louver grille, medium bronze anodized aluminum for 2, 2-1/2, 3, 3-1/2 Ton QTEç Models [™]					
QLG-25	Outdoor louver grille, medium bronze anodized aluminum for 4 Ton QTEC Models TM					
QLG-30	Outdoor louver grille, dark bronze anodized aluminum for 2, 2-1/2, 3, 3-1/2 Ton QTEC Models TM					
QLG-35	Outdoor louver grille, dark bronze anodized aluminum for 4 Ton QTEC Models ***					
QWS42	14 Inch wall sleeve for 2, 2-1/2, 3, 3-1/2 Ton QTEc Models. ™Required for all units.					
QWS48	14 Inch wall sleeve for 4 Ton QTEc Models. Required for all units.					
QSTX42	Side trim piece extension for 2, 2-1/2, 3, 3-1/2 Ton QTEC Models. Provides cabinet extension between interiously all and unit when wall thickness is between 5 inches and 12 inches.					
QPB42	Free blow plenum box for 2, 2-1/2, 3, 3-1/2 Ton QTEC Models. Includes front supply grilles.					
QPB48	Free blow plenum box for 4 Ton QTEc Models. Includes front supply grilles.					
QCX-10	Cabinet extension for ducted applications on 2, 2-1/2, 3, 3-1/2 Ton QTEc Models.™Height will be 20 inches high.					
QCX-15	Cabinet extension for ducted applications on 4 Ton QTEc Model [™] . Height will be 20 inches high.
